PROTOTYPING AND DESIGN VALIDATION STUDIO

Create a CampusConnect avatar video

Week 8 guided lab using HeyGen and GitHub

Create one short video with a public stock avatar. Then post its share link, complete script, and five brief checks in your existing GitHub repository. **Allow 45 minutes**, including video processing time.

Why we are building this

A first-time CampusConnect user needs to understand the supported IT topics, the privacy boundary, and when to seek human help. Your prototype tests whether a short presenter communicates that message clearly. The video is a prerecorded introduction; it does not answer questions.

Activity	Minutes
Open the GitHub trail	5
Create the HeyGen video	15
Watch and share the video	10
Record checks and submit the GitHub link	15

Before you begin: Have access to your individual CampusConnect GitHub repository and a HeyGen account. Use one public stock avatar and one final generation. Use the available free allowance; if HeyGen requires payment or credits you do not have, ask your instructor before proceeding.

Part 1 Open the GitHub trail

Step 1 Create the Week 8 branch

Open https://github.com/

1. Sign in and open the **same individual CampusConnect repository** used in Weeks 1, 3, 4, and 7.
2. On the **Code** tab, select **main** in the branch menu. Open that menu again and enter **feature/week-8-avatar-prototype**.
3. Click **Create branch: feature/week-8-avatar-prototype from main**. If this branch already exists, select it.

Step 2 Start the validation file

1. With the Week 8 branch selected, click **Add file > Create new file**. Enter **docs/prototypes/week-8/VIDEO_VALIDATION.md** as the filename.
2. Paste the template on the next page. Replace your name and date. Click **Commit changes**, enter **Start Week 8 video validation**, and commit to the current branch. If the file already exists, open it and click the pencil icon to edit it.

Copy into your GitHub validation file

Copy the text below once. You will fill in the remaining placeholders after the video is ready. Keep this GitHub tab open.

```
# Week 8 AI Presenter Prototype and Validation

Student: <YOUR NAME>
Date: <DATE>
Branch: feature/week-8-avatar-prototype
HeyGen project: <TITLE SHOWN IN HEYGEN>

## Prototype hypothesis
A short AI presenter will help a new user understand the supported
IT topics, privacy boundary, and human fallback.

## Shared video
AI-generated presenter - not a live staff member.
This is a prerecorded introduction. It does not answer questions.
[Watch the CampusConnect presenter](PASTE_HEYGEN_SHARE_LINK_HERE)

## Transcript
<PASTE THE COMPLETE SCRIPT FROM STEP 6 HERE>

## Five checks
1. AI disclosure, IT topics, privacy, and fallback: <OBSERVED; PASS/REVISE>
2. Full script and video duration: <SECONDS; OBSERVED; PASS/REVISE>
3. Captions on and readable: <OBSERVED; PASS/REVISE>
4. Muted video and GitHub transcript: <OBSERVED; PASS/REVISE>
5. Share link works without HeyGen sign-in: <OBSERVED; PASS/REVISE>

## Design decision
Decision: <KEEP / CHANGE / REMOVE the presenter idea>
Reason based on my checks: <ONE SENTENCE>
One improvement for later: <ONE SENTENCE>

## Engineering and AI Use Log
AI tool used: HeyGen
What HeyGen generated: <ONE SENTENCE>
What I verified myself: <ONE SENTENCE>
Remaining limitation: <ONE SENTENCE>
```

Save time: Do not create additional folders or files. All of your Week 8 evidence goes in this one Markdown file. GitHub creates the folders from the slashes in the filename.

Part 2 Create the video in HeyGen

Step 3 Open Video Agent from Apps

Open https://app.heygen.com/ and sign in. If needed, create a HeyGen account.

1. Click **Apps** in the far-left navigation. In **App Library**, keep **All Apps** selected.
2. In the **Prompt to Video** banner, click **Try Video Agent**.

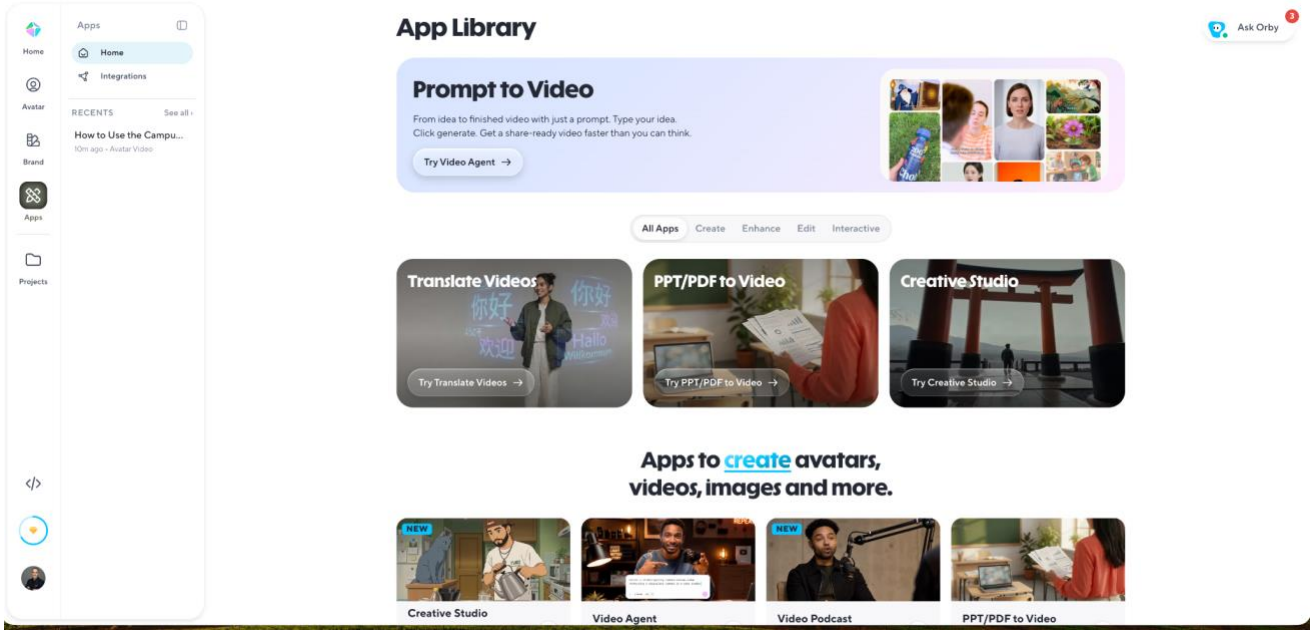

Figure 1 Apps opens the App Library. Try Video Agent is in the top banner.

Step 4 Dismiss the quick tour

1. On **What should your video be about?**, click **Skip tour** if the Quick tour pop-up appears.
2. Leave the **Add inspiration** tiles at their defaults. Use the large script area on the right.

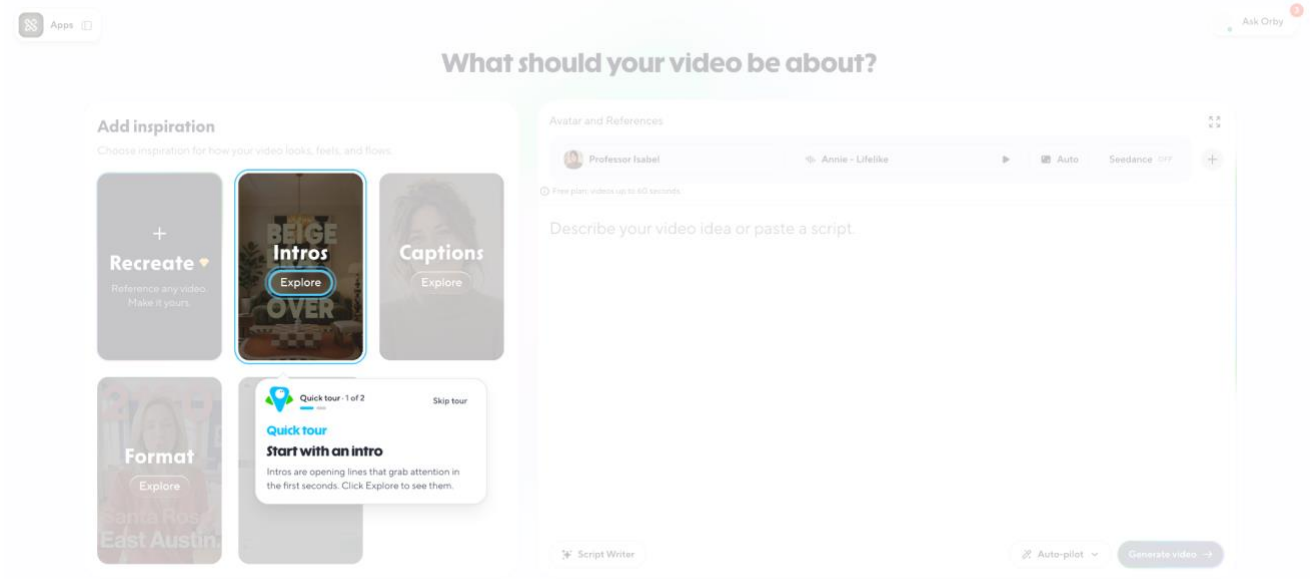

Figure 2 The quick tour overlays the page. Skip tour clears it.

Step 5 Choose a public stock avatar

1. Under **Avatar and References**, click the **avatar name and picture** at the left of the top row. This is separate from the voice control next to it.
2. In **Choose Avatar**, select **Public Avatars**. Click **Sawyer**, as in the example, or another available public stock avatar. If HeyGen displays several looks, choose one available with your plan and confirm the selection.
3. Back on the script page, keep the avatar's preset voice. Use the small play triangle in the voice control to preview it.

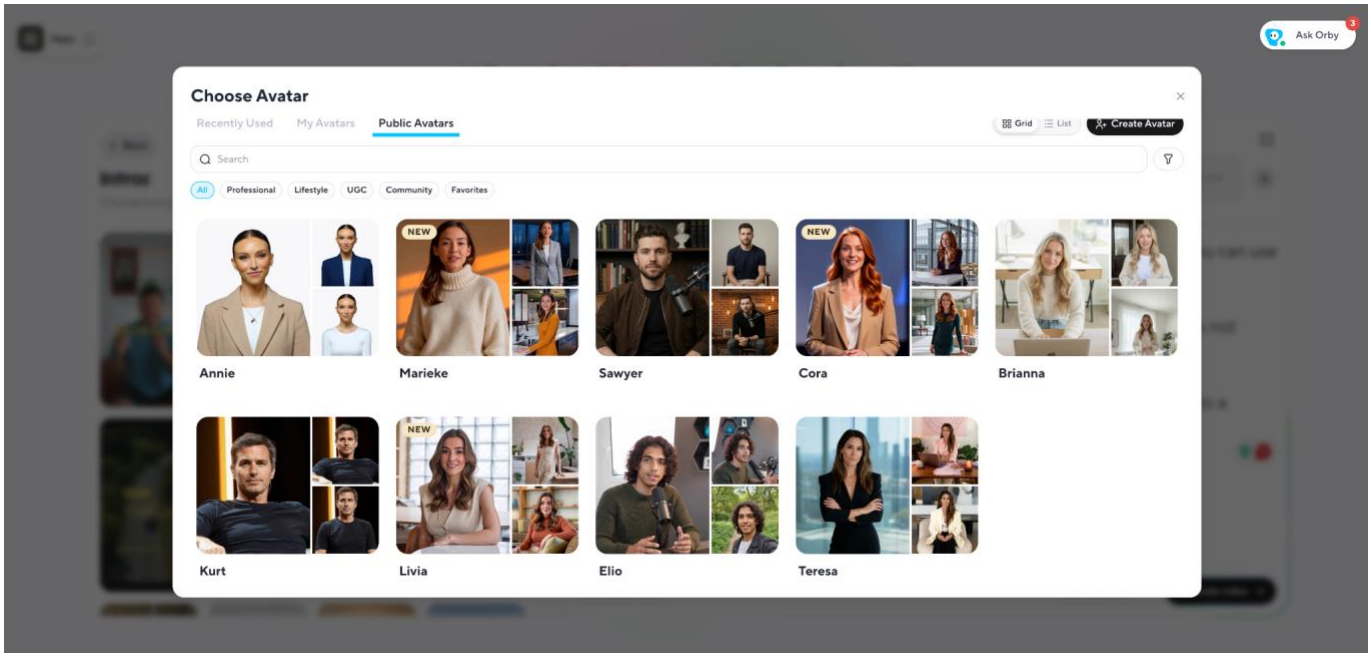

Figure 3 Public Avatars contains the ready-made presenters used in this lab.

Step 6 Paste the CampusConnect script

Click the large field labeled **Describe your video idea or paste a script**. Delete any sample text and paste all three paragraphs below. The same text will be your GitHub transcript.

Copy and paste into HeyGen

Hello. I am an AI-generated CampusConnect presenter, not a live staff member. You can use CampusConnect for approved campus IT help.

Ask about password resets, secure campus Wi-Fi, or the IT Service Desk. Please do not share passwords, recovery codes, student records, or other private information.

If the chatbot cannot support an answer from its approved guide, it will direct you to a human. This video is a prerecorded introduction. You can read the same script in our GitHub project.

Keep it simple: Use the public stock avatar. A portrait video is acceptable, as shown in the finished example. The goal is a clear introduction, not a complex video edit.

Step 7 Generate the video once

1. Confirm that the avatar and voice are selected and the complete script is in the large text field. Leave **Auto**, **Seedance OFF**, and **Auto-pilot** as shown below.
2. Click **Generate video** at the bottom right. If HeyGen shows a plan or a credit confirmation, check the script and available allowance, then approve that one generation.

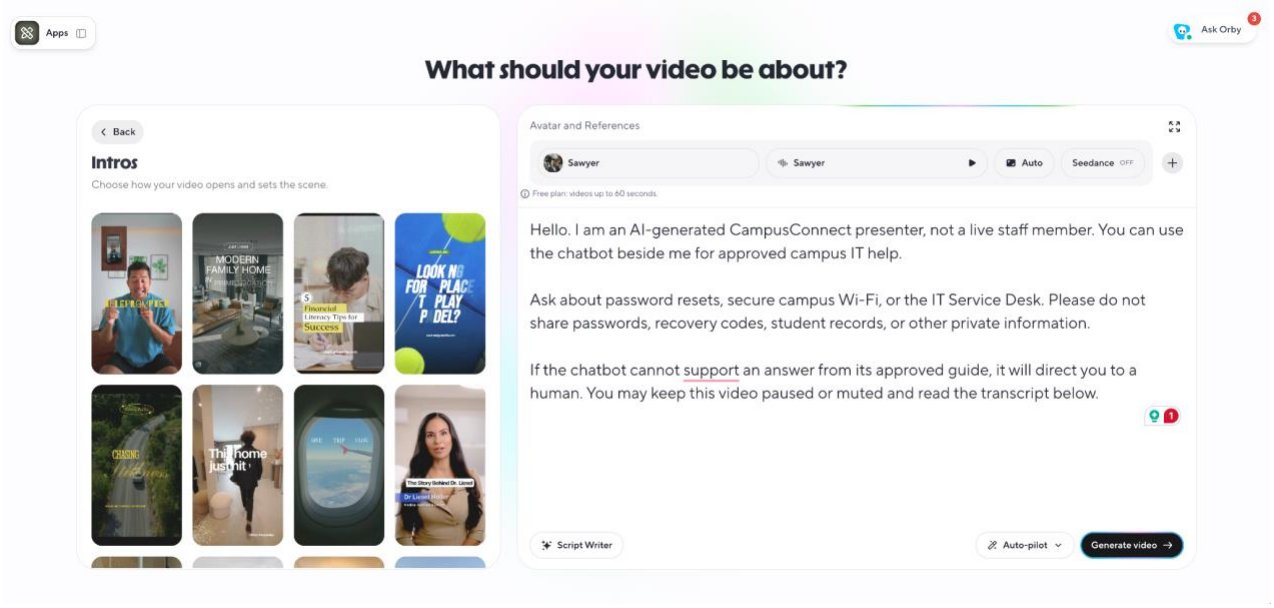

Figure 4 Script field and Generate video. Use the updated script from Step 6.

Step 8 Watch the completed video

1. Keep the tab open while processing finishes. On the finished screen, play the video. Next to **Captions** below the player, click **On**.
2. Check that the narration follows your script. Record the actual duration; a complete video slightly under 30 seconds is acceptable. Keep the video within 60 seconds.

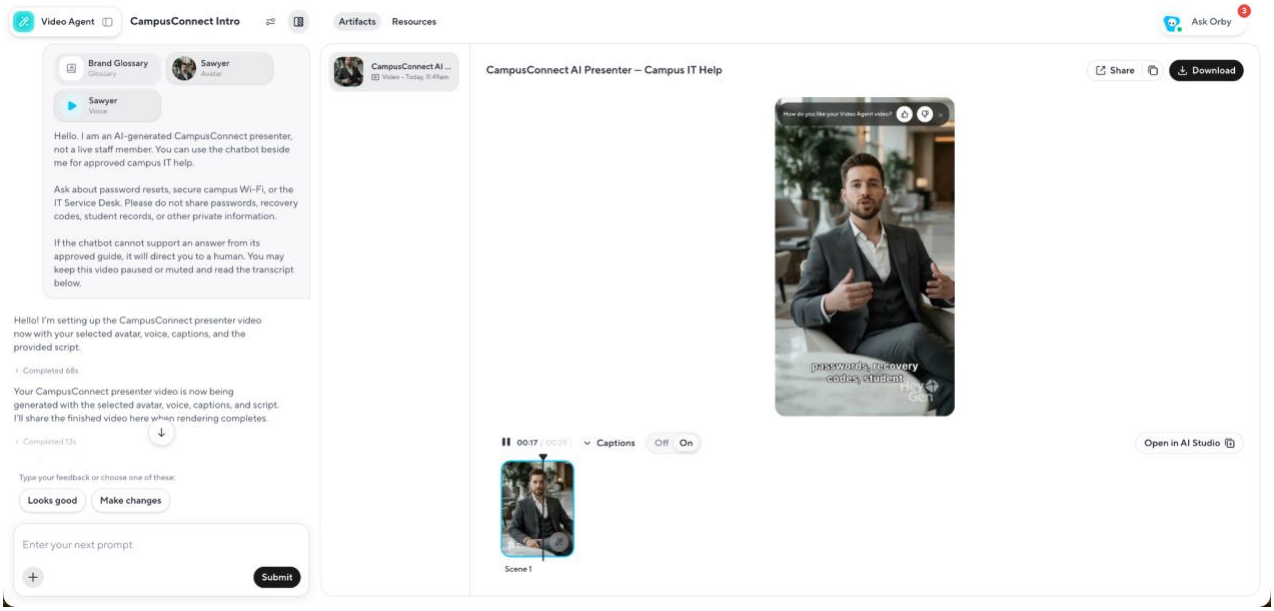

Figure 5 Example finished video with Captions below the player and Share above it.

Part 3 Share and check the video

Step 9 Copy a link that viewers can open

1. On the finished video screen, click **Share** near the upper right.
2. In **Share this video**, choose **Anyone with the link**. Leave **Require password** off.
3. Click **Copy link**. Keep this copied link for Step 10. It is the viewing link for your finished video.

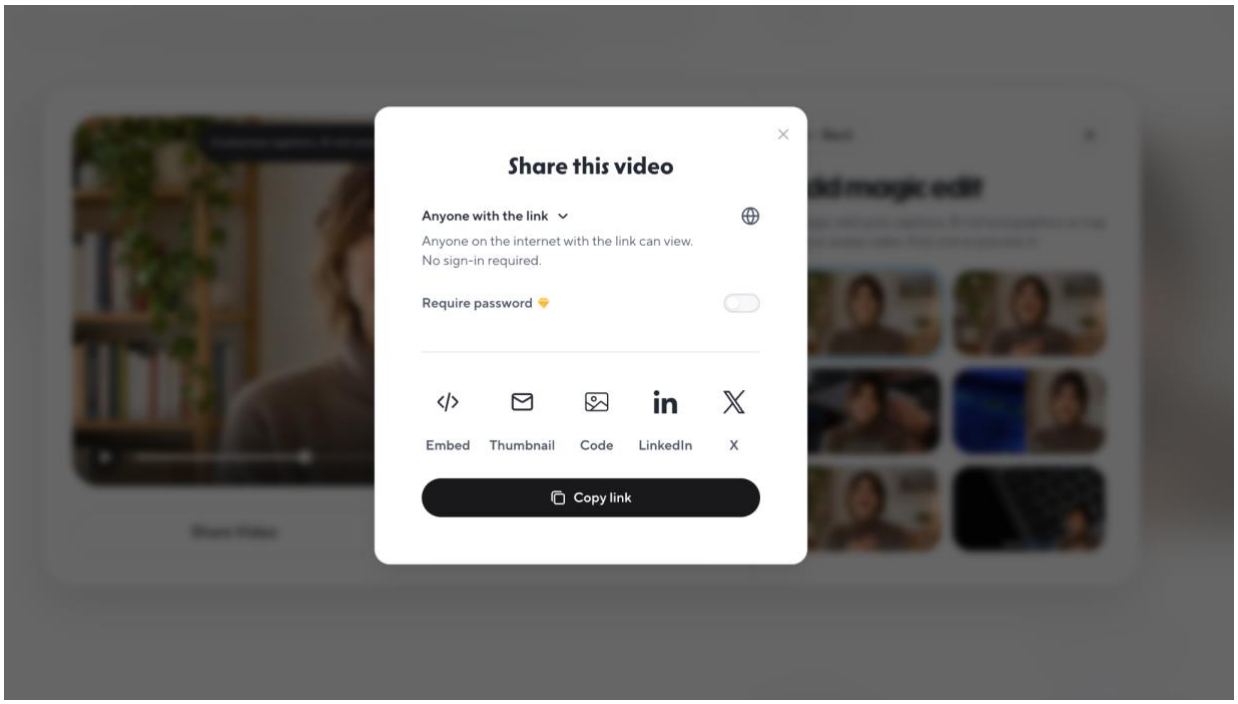

Figure 6 Anyone with the link allows viewing without HeyGen sign-in. Click Copy link.

Run these five short checks

Use **Pass** when you observe the expected result. Use **Revise** when something is missing, and describe it honestly. Complete Check 4 after posting the transcript in Step 10.

Check	What to verify
1 Message	The opening discloses AI. The narration names IT topics, warns against sharing private information, and explains human fallback.
2 Playback	The whole script is spoken and the video is no longer than 60 seconds. Record the actual duration.
3 Captions	With Captions On, the words are readable and match the essential spoken message.
4 Text access	Mute or pause the video. Read the complete transcript in GitHub without needing the audio.
5 Sharing	Paste the copied link into a private or incognito browser window. Confirm you can watch without signing in to HeyGen.

If a check fails: Fix the share setting or GitHub text where possible. Record a narration or video problem as a future improvement; do not spend another generation during this lab.

Part 4 Post the shared video to GitHub

Step 10 Add the video link and complete your record

1. Return to your GitHub repository. Confirm **feature/week-8-avatar-prototype** is selected. Open **docs/prototypes/week-8/VIDEO_VALIDATION.md** and click the **pencil icon**.
2. In the **Watch the CampusConnect presenter** line, replace only **PASTE_HEYGEN_SHARE_LINK_HERE** with the link from **Copy link**. Keep the square brackets and parentheses.
3. Record the project title shown in HeyGen. Under **Transcript**, replace the placeholder with all three script paragraphs from Step 6. Complete the five checks, design decision, and short AI Use Log.
4. Click **Preview**. Confirm the video link is clickable and the transcript is readable. Finish Check 4, then return to **Edit** to record the result.
5. Click **Commit changes**. Use **Record Week 8 validation evidence** and commit directly to the current Week 8 branch.

You are posting the shared video as a link. Keep the video in HeyGen. The GitHub file holds the viewing link, transcript, and validation evidence.

Step 11 Open a draft pull request

1. Click **Compare & pull request**. If the banner is absent, open **Pull requests > New pull request**. Set **base: main** and **compare: feature/week-8-avatar-prototype**.
2. If a comparison page appears, click **Create pull request** to open the title and description fields. Use the title **Week 8: validate AI presenter prototype**. Paste the description below.
3. Use the drop-down beside **Create pull request** to select **Create draft pull request**, then create it. Submit the **draft pull-request URL** to your instructor. Leave it unmerged.

Copy and paste into the pull request description

```
## Week 8 prototype
- Created one HeyGen public-stock-avatar presenter video.
- Posted the viewing link, AI disclosure, and full transcript.
- Recorded five checks and one design decision.

## Evidence
See docs/prototypes/week-8/VIDEO_VALIDATION.md.
```

Before you submit

Confirm that your **video link works without HeyGen sign-in**, your **complete transcript and five check results** are in the correct file, and your **draft pull request** contains the Week 8 changes.

100-point rubric: Video and script 30; disclosure, captions, and transcript 25; five checks and decision 25; GitHub branch, record, and draft pull request 20.
